# Argument Estimates of Certain Meromorphic Functions

Nak Eun Cho <sup>1</sup>, Soon Young Woo <sup>1</sup> and Shigeyoshi Owa <sup>2</sup>

Presented by V. Kiraykova

The object of the present paper is to derive some argument properties of certain meromorphic functions in the punctured open unit disk. Furthermore, we investigate their integral-preserving property in a sector.

AMS Subj. Classification: 30C45, 30D30

Key Words: argument properties, meromorphic starlike functions, subordination, meromorphic close-to-convex functions, univalent functions, integral operators

### 1. Introduction

Let  $\Sigma$  denote the class of functions of the form

$$f(z) = \frac{1}{z} + \sum_{n=0}^{\infty} a_n z^n,$$

which are analytic in the punctured open unit disk  $\mathcal{D}=\{z:z\in\mathbb{C} \text{ and } 0<|z|<1\}$ . We denote by  $\Sigma^*(\gamma)$  the subclasses of  $\Sigma$  consisting of all functions which is meromorphic starlike of order  $\gamma$  in  $\mathcal{U}=\mathcal{D}\cup\{0\}$   $(0\leq\gamma<1)$ . For analytic functions g and h with g(0)=h(0), g is said to be subordinate to h, if there exists an analytic function w such that w(0)=0, |w(z)|<1  $(z\in\mathcal{U}),$  and g(z)=h(w(z)). We denote this subordination by  $g\prec h$  or  $g(z)\prec h(z).$  Let

$$\Sigma^*[A, B] = \left\{ f \in \mathcal{A} : \frac{zf'(z)}{f(z)} \prec \frac{1 + Az}{1 + Bz} \ (z \in \mathcal{U} \ ; \ -1 \le B < A \le 1) \right\}. \tag{1.1}$$

In particular, we note that  $\Sigma^*[1-2\gamma,-1] = \Sigma^*(\gamma)$   $(0 \le \gamma < 1)$ . Furthermore, from (1.1), we observe [5] that a function f is in  $\Sigma^*[A,B]$  if and only if

$$\left| \frac{zf'(z)}{f(z)} + \frac{1 - AB}{1 - B^2} \right| < \frac{A - B}{1 - B^2} \quad (-1 < B < A \le 1 \; ; \; z \in \mathcal{U}). \tag{1.2}$$

A function  $f \in \Sigma$  is said to be in the class  $\Sigma_c(\gamma, \beta)$ , if there is a meromorphic starlike function g of order  $\gamma$  such that

$$-\operatorname{Re}\left\{\frac{zf'(z)}{g(z)}\right\} > \beta \quad (0 \le \beta < 1 \; ; \; z \in \mathcal{U}).$$

Libera and Robertson [2] showed that  $\Sigma_c(0,0)$ , the class of meromorphic close-to-convex functions, is not univalent. Also,  $\Sigma_c(\gamma,\beta)$  provides an interesting generalization of the class of meromorphic close-to-convex functions [6].

In the present paper, we give some argument properties of the aforementioned classes of meromorphic functions in the open unit disk. An application of a certain integral operator is also considered.

#### 2. Main results

In proving our main results, we need the following lemmas.

**Lemma 2.1.** ([1]) Let h be convex univalent in  $\mathcal{U}$  with h(0) = 1 and Re  $(\beta h(z) + \gamma) > 0$   $(\beta, \gamma \in \mathbb{C})$ . If q is analytic in  $\mathcal{U}$  with q(0) = 1, then

$$q(z) + \frac{zq'(z)}{\beta q(z) + \gamma} \prec h(z) \quad (z \in \mathcal{U})$$

implies

$$q(z) \prec h(z) \quad (z \in \mathcal{U}).$$

**Lemma 2.2.** ([3]) Let h be convex univalent in  $\mathcal{U}$  and  $\lambda$  be analytic in  $\mathcal{U}$  with Re  $\lambda(z) \geq 0$ . If q is analytic in  $\mathcal{U}$  and q(0) = h(0), then

$$q(z) + \lambda(z)zq'(z) \prec h(z) \quad (z \in \mathcal{U})$$

implies

$$q(z) \prec h(z) \quad (z \in \mathcal{U}).$$

**Lemma 2.3.** ([4]) Let q be analytic in U with q(0) = 1 and  $q(z) \neq 0$  in U. Suppose that there exists a point  $z_0 \in U$  such that

$$\left| \arg q(z) \right| < \frac{\pi}{2} \eta \text{ for } |z| < |z_0|$$
 (2.1)

and

$$\left| \arg q(z_0) \right| = \frac{\pi}{2} \eta \quad (0 < \eta \le 1).$$
 (2.2)

Then we have

$$\frac{z_0 q'(z_0)}{q(z_0)} = ik\eta, (2.3)$$

where

$$k \ge \frac{1}{2} \left( a + \frac{1}{a} \right)$$
 when  $\arg q(z_0) = \frac{\pi}{2} \eta$  (2.4)

$$k \le -\frac{1}{2} \left( a + \frac{1}{a} \right) \quad when \quad \arg \quad q(z_0) = -\frac{\pi}{2} \eta \tag{2.5}$$

and

$$q(z_0)^{\frac{1}{\eta}} = \pm ia \ (a > 0).$$
 (2.6)

By using the above lemmas, we now derive the following theorem.

**Theorem 2.1.** Let  $f \in \Sigma$  and suppose that

$$1 + B > \alpha(2 + A + B)$$
  $\left(-1 < B < A \le 1 ; 0 < \alpha < \frac{1}{2}\right).$ 

If

$$\left| \arg \left( -\frac{\alpha z (zf'(z))' + (1-\alpha)zf'(z)}{\alpha zg'(z) + (1-\alpha)g(z)} - \beta \right) \right| < \frac{\pi}{2}\delta \quad (0 \le \beta < 1 \ ; \ 0 < \delta \le 1)$$

for some  $g \in \Sigma^*[A, B]$ , then

$$\left| \arg \left( -\frac{zf'(z)}{g(z)} - \beta \right) \right| < \frac{\pi}{2}\eta,$$

where  $\eta$  (0 <  $\eta \le 1$ ) is the solution of the equation:

$$\delta = \eta + \frac{2}{\pi} \tan^{-1} \left( \frac{\eta \sin[\frac{\pi}{2} \{ 1 - t(A, B, \alpha) \}]}{\left( \frac{1+A}{1+B} + \frac{1}{\alpha} - 1 \right) + \eta \cos[\frac{\pi}{2} \{ 1 - t(A, B, \alpha) \}]} \right)$$
(2.7)

and

$$t(A, B, \alpha) = \frac{2}{\pi} \sin^{-1} \left( \frac{A - B}{(\frac{1}{\alpha} - 1)(1 - B^2) - (1 - AB)} \right).$$
 (2.8)

Proof. Let

$$q(z) = -\frac{1}{1-\beta} \left( \frac{zf'(z)}{g(z)} + \beta \right)$$
 and  $r(z) = -\frac{zg'(z)}{g(z)}$ .

Then, by a simple calculation, we have

$$-\frac{1}{1-\beta} \left( \frac{\alpha z (zf'(z))' + (1-\alpha)zf'(z)}{\alpha z g'(z) + (1-\alpha)g(z)} + \beta \right)$$

$$= q(z) + \frac{zq'(z)}{-r(z) + (\frac{1}{2} - 1)}.$$

Since  $g \in \Sigma^*[A, B]$ , from (1.2), we have

$$r(z) \prec \frac{1+Az}{1+Rz} \quad (z \in \mathcal{U}).$$

If we let

$$-r(z) + (\frac{1}{\alpha} - 1) = \rho e^{i\frac{\pi\phi}{2}} \quad (z \in \mathcal{U}),$$

then it follows from (1.1) and (1.2) that

$$\begin{cases} \frac{(\frac{1}{\alpha}-1)(1+B)-(1+A)}{1+B} < \rho < \frac{(\frac{1}{\alpha}-1)(1-B)-(1-A)}{1-B}, \\ -t(A,B,\alpha) < \phi < t(A,B,\alpha), \end{cases}$$

where  $t(A,B,\alpha)$  is defined by (2.8). Let h be a function which maps  $\mathcal U$  onto the angular domain  $\{w: |\arg w| < \frac{\pi}{2}\delta\}$  with h(0)=1. Applying Lemma 2.2 for this h with  $\lambda(z)=\frac{1}{-r(z)+\frac{1}{\alpha}-1}$ , we see that  $\operatorname{Re}\ q(z)>0$  in  $\mathcal U$  and hence  $q(z)\neq 0$  in  $\mathcal U$ .

If there exists a point  $z_0 \in \mathcal{U}$  such that the conditions (2.1) and (2.2) are satisfied, then (by Lemma 1) we obtain (2.3) under the restrictions (2.4), (2.5) and (2.6).

First, we suppose that

$$\{q(z_0)\}^{\frac{1}{\eta}}=ia \quad (a>0).$$

Then we obtain

$$\arg\left(-\frac{\alpha z_{0}(z_{0}f'(z_{0}))' + (1-\alpha)z_{0}f'(z_{0})}{\alpha z_{0}g'(z_{0}) + (1-\alpha)g(z_{0})} - \beta\right)$$

$$= \arg\left(q(z_{0}) + \frac{z_{0}q'(z_{0})}{-r(z_{0}) + (\frac{1}{\alpha} - 1)}\right)$$

$$= \arg\left\{q(z_{0})\left(1 + \frac{z_{0}q'(z_{0})}{q(z_{0})} - \frac{1}{-r(z_{0}) + (\frac{1}{\alpha} - 1)}\right)\right\}$$

$$= \arg\left\{q(z_{0})\right\} + \arg\left(1 + i\eta k(\rho e^{i\frac{\pi\phi}{2}})^{-1}\right)$$

$$= \frac{\pi}{2}\eta + \tan^{-1}\left(\frac{\eta k \sin\left[\frac{\pi}{2}(1 - \phi)\right]}{\rho + \eta k \cos\left[\frac{\pi}{2}(1 - \phi)\right]}\right)$$

$$\geq \frac{\pi}{2}\eta + \tan^{-1}\left(\frac{\eta \sin\left[\frac{\pi}{2}\left\{1 - t(A, B, \alpha)\right\}\right]}{\left(\frac{(\frac{1}{\alpha} - 1)(1 - B) - (1 - A)}{1 - B}\right) + \eta \cos\left[\frac{\pi}{2}\left\{1 - t(A, B, \alpha)\right\}\right]}\right) = \frac{\pi}{2}\delta,$$

where  $\delta$  and  $t(A, B, \alpha)$  are given by (2.7) and (2.8), respectively. This evidently contradicts the assumption of Theorem 2.1.

Next, we suppose that

$$q(z_0)^{\frac{1}{\eta}} = -ia \quad (a > 0).$$

Applying the same method as above, we have

$$\arg\left(-\frac{\alpha z_0(z_0 f'(z_0))' + (1-\alpha)z_0 f'(z_0)}{\alpha z_0 g'(z_0) + (1-\alpha)g(z_0)} - \beta\right)$$

$$\leq -\frac{\pi}{2} \eta - \tan^{-1}\left(\frac{\eta \sin\left[\frac{\pi}{2}\left\{1 - t(A, B, \alpha)\right\}\right]}{\left(\frac{\left(\frac{1}{\alpha} - 1\right)(1-B) - \left(1-A\right)}{1-B}\right) + \eta \cos\left[\frac{\pi}{2}\left\{1 - t(A, B, \alpha)\right\}\right]}\right) = -\frac{\pi}{2}\delta,$$

where  $\delta$  and  $t(A, B, \alpha)$  are given by (2.7) and (2.8), respectively. This also contradict the assumption of Theorem 2.1. Therefore, we complete the proof of Theorem 2.1.

Letting A = 1, B = 0 and  $\delta = 1$  in Theorem 2.1, we have

Corollary 2.1. Let  $f \in \Sigma$ . If

$$-Re\left\{\frac{\alpha z(zf'(z))'+(1-\alpha)zf'(z)}{\alpha zg'(z)+(1-\alpha)g(z)}\right\} > \beta \quad \left(0<\alpha<\frac{1}{3};\ 0\leq\beta<1\right)$$

for some  $g \in \Sigma$  satisfying the condition:

$$\left| \frac{zg'(z)}{g(z)} + 1 \right| < 1 \quad (z \in \mathcal{U}),$$

then

$$-\operatorname{Re}\left\{\frac{zf'(z)}{g(z)}\right\} \ > \ \beta \quad (0 \le \beta < 1).$$

If we put  $g(z) = \frac{1}{z}$  in Theorem 2.1, then by letting  $B \to A$  (A < 1), we obtain

Corollary 2.2. Let  $f \in \Sigma$ . If

$$\left| \arg \left( -\frac{z^2(f'(z) + \alpha z f''(z))}{1 - 2\alpha} - \beta \right) \right| < \frac{\pi}{2} \delta \quad \left( 0 < \alpha < \frac{1}{2}; \ 0 \le \beta < 1; \ 0 < \delta \le 1 \right)$$

then

$$\left| \arg \left\{ -z^2 f'(z) - \beta \right\} \right| < \frac{\pi}{2} \eta,$$

where  $\eta$  (0 <  $\eta \le 1$ ) is the solution of the equation:

$$\delta = \eta + \frac{2}{\pi} \tan^{-1}(\alpha \eta). \tag{2.9}$$

The proof of Theorem 2.2 below is much akin to that of Theorem 2.1. The details may be omitted.

**Theorem 2.2.** Let  $f \in \Sigma$  and suppose that

$$1 + B > \alpha(2 + A + B)$$
  $\left(-1 < B < A \le 1; \ 0 < \alpha < \frac{1}{2}\right)$ .

If

$$\left|\arg \left(\beta + \frac{\alpha z(zf'(z))' + (1-\alpha)zf'(z)}{\alpha zg'(z) + (1-\alpha)g(z)}\right)\right| < \frac{\pi}{2}\delta \quad (\beta > 1; \ 0 < \delta \leq 1)$$

for some  $g \in \Sigma^*[A, B]$ , then

$$\left| \arg \left( \beta + \frac{zf'(z)}{g(z)} \right) \right| < \frac{\pi}{2} \eta,$$

where  $\eta$  (0 <  $\eta \le 1$ ) is the solution of the equation (2.7).

For a function f belonging to the class  $\Sigma$ , we define the integral operator  $F_{\alpha}$  as follows:

$$F_{\alpha}(f) := F_{\alpha}(f)(z) = \frac{1 - 2\alpha}{\alpha z^{\frac{1}{\alpha} - 1}} \int_{0}^{z} t^{\frac{1}{\alpha} - 2} f(t) dt$$

$$(0 < \alpha < \frac{1}{2}; \ z \in \mathcal{D}).$$

$$(2.10)$$

The following lemma will be required for the proof of Theorem 2.3 below.

**Lemma 2.4.** Let  $f \in \Sigma$  and let h be a convex (univalent) function in  $\mathcal{U}$  with h(0) = 1 and  $Re\{h(z)\} > 0$  in  $\mathcal{U}$ . If

$$-\frac{zf'(z)}{f(z)} \prec h(z) \quad (z \in \mathcal{U}),$$

then

$$-\frac{zF_{\alpha}'(f)}{F_{\alpha}(f)} \prec h(z) \quad (z \in \mathcal{U}),$$

for  $\max_{z \in \mathcal{U}} \operatorname{Re} h(z) < \frac{1}{\alpha} - 1$   $(0 < \alpha < \frac{1}{2})$ , where  $F_{\alpha}$  is defined by (2.10).

Proof. From the definition (2.10), we get

$$\alpha z F'_{\alpha}(f)(z) + (1 - \alpha)F_{\alpha}(f)(z) = (1 - 2\alpha)f(z)$$
 (2.11)

Let

$$q(z) = -\frac{zF'_{\alpha}(f)}{F_{\alpha}(f)}.$$

Then (2.11) yields

$$q(z) - \left(\frac{1}{\alpha} - 1\right) = -\left(\frac{1}{\alpha} - 2\right) \frac{f(z)}{F_{\alpha}(f)}.$$
 (2.12)

Taking logarithmic derivatives in (2.12) and multiplying by z, we get

$$q(z) + \frac{zq'(z)}{-q(z) + \frac{1}{z} - 1} = -\frac{zf'(z)}{f(z)} \prec h(z) \ (z \in \mathcal{U}).$$

Therefore, by Lemma 2.1, we have that  $q(z) \prec h(z)$  for  $\max_{z \in \mathcal{U}} \operatorname{Re} h(z) < \frac{1}{\alpha} - 1$  (0 <  $\alpha < \frac{1}{2}$ ). This evidently completes the proof of Lemma 2.4.

Next, we prove the following theorem.

**Theorem 2.3.** Let  $f \in \Sigma$  and suppose that

$$1 + B > \alpha(2 + A + B)$$
  $\left(-1 < B < A \le 1; \ 0 < \alpha < \frac{1}{2}\right)$ .

If

$$\left| \arg \left( -\frac{\alpha z (zf'(z))' + (1-\alpha)zf'(z)}{\alpha zg'(z) + (1-\alpha)g(z)} - \beta \right) \right| < \frac{\pi}{2}\delta \quad (0 < \alpha \le 1; \ \beta > 1; \ 0 < \delta \le 1)$$

for some  $g \in \Sigma^*[A, B]$ , then

$$\left| \arg \left( -\frac{\alpha z (z F_{\alpha}'(f))' + (1 - \alpha) z F_{\alpha}'(f)}{\alpha z F_{\alpha}'(g) + (1 - \alpha) F_{\alpha}(g)} - \beta \right) \right| < \frac{\pi}{2} \eta, \tag{2.13}$$

where  $F_{\alpha}$  is given by (2.10) and  $\eta$  (0 <  $\eta \leq 1$ ) is the solution of the equation (2.7).

Proof. Since  $g \in \Sigma^*[A, B]$ , by applying Lemma 2.4, the function  $F_{\alpha}(g)$  belongs to the class  $\Sigma[A, B]$ . Then, from (2.11), we get

$$-\frac{\alpha z(zF'_{\alpha}(f))' + (1-\alpha)zF'_{\alpha}(f)}{\alpha zF'_{\alpha}(g) + (1-\alpha)F_{\alpha}(g)} = -\frac{zf'(z)}{g(z)}.$$

Hence, by the hypothesis and Theorem 2.1, we have (2.13), which completes the proof of Theorem 2.3.

Taking A = 1, B = 0 and  $\delta = 1$  in Theorem 2.3, we have

Corollary 2.3. Let  $f \in \Sigma$ . If

$$-Re\left\{\frac{\alpha z(zf'(z))' + (1-\alpha)zf'(z)}{\alpha zg'(z) + (1-\alpha)g(z)}\right\} > \beta \quad (0 \le \beta < 1)$$

for some  $g \in \Sigma$  satisfying the condition:

$$\left|\frac{zg'(z)}{g(z)} + 1\right| < 1 \ (z \in \mathcal{U}),$$

then

$$-Re\left\{\frac{\alpha z(zF_{\alpha}'(f))'+(1-\alpha)zF_{\alpha}'(f)}{\alpha zF_{\alpha}'(g)+(1-\alpha)F_{\alpha}(g)}\right\} > \beta \quad (0 \le \beta < 1).$$

Putting  $g(z) = \frac{1}{z}$  in Theorem 2.3, and then by letting  $B \to A$  (A < 1), we obtain

Corollary 2.4. Let  $f \in \Sigma$ . If

$$\left| \arg \left( -\frac{z^2 (f'(z) + \alpha z f''(z)}{1 - 2\alpha} - \beta \right) \right| < \frac{\pi}{2} \delta \quad (0 < \alpha < \frac{1}{2}; \ 0 \le \beta < 1; \ 0 < \delta \le 1),$$

then

$$\left| \arg \left( -\frac{z^2 (F'_{\alpha}(f) + \alpha z F''_{\alpha}(f)}{1 - 2\alpha} - \beta \right) \right| < \frac{\pi}{2} \eta \quad (0 < \alpha < \frac{1}{2}; \ 0 \le \beta < 1; \ 0 < \delta \le 1),$$

where  $\eta$  (0 <  $\eta \le 1$ ) is the solution of the equation (2.9).

By a similar method of the proof in Theorem 2.3, we get the next theorem.

**Theorem 2.4.** Let  $f \in \Sigma$  and suppose that

$$1 + B > \alpha(2 + A + B) \left( -1 < B < A \le 1; \ 0 < \alpha < \frac{1}{2} \right).$$

If

$$\left| \arg \left( \beta + \frac{\alpha z (zf'(z))' + (1 - \alpha)zf'(z)}{\alpha z g'(z) + (1 - \alpha)g(z)} \right) \right| < \frac{\pi}{2} \delta \quad (0 < \alpha \le 1; \ \beta > 1; \ 0 < \delta \le 1)$$

for some  $g \in \Sigma^*[A, B]$ , then

$$\left| \arg \left( \beta + \frac{\alpha z (z F_{\alpha}'(f))' + (1 - \alpha) z F_{\alpha}'(f)}{\alpha z F_{\alpha}'(g) + (1 - \alpha) F_{\alpha}(g)} \right) \right| < \frac{\pi}{2} \eta, \tag{2.13}$$

where  $F_{\alpha}$  is given by (2.10) and  $\eta$  (0 <  $\eta \le 1$ ) is the solution of the equation (2.7).

Finally, we prove

Theorem 2.5. Let  $f \in \Sigma$ . If

$$\left| \arg \left[ -\left( \alpha \frac{(zf'(z))'}{g'(z)} + (1-\alpha) \frac{zf'(z)}{g(z)} \right) - \beta \right] \right| < \frac{\pi}{2} \delta \quad (\alpha < 0; \ 0 \le \beta < 1; \ 0 < \delta \le 1)$$

for some  $g \in \Sigma^*[A, B]$ , then

$$\left| \arg \left( -\frac{zf'(z)}{g(z)} - \beta \right) \right| < \frac{\pi\eta}{2},$$

and  $\eta$  (0 <  $\eta \le 1$ ) is the solution of the equation:

$$\delta = \eta + \frac{2}{\pi} \tan^{-1} \left( \frac{-\alpha \eta \sin\left[\frac{\pi}{2} \left\{1 - \sin^{-1}\left(\frac{A - B}{1 - AB}\right)\right\}\right]}{\frac{1 + A}{1 + B} - \alpha \eta \cos\left[\frac{\pi}{2} \left\{1 - \sin^{-1}\left(\frac{A - B}{1 - AB}\right)\right\}\right]} \right).$$

Proof. Setting

$$q(z) = -\frac{1}{1-\beta} \left( \frac{zf'(z)}{g(z)} + \beta \right)$$
 and  $r(z) = -\frac{zg'(z)}{g(z)}$ ,

we have

$$-\frac{1}{1-\beta}\left(\alpha\frac{(zf'(z))'}{g'(z)}+(1-\alpha)\frac{zf'(z)}{g(z)}+\beta\right)=q(z)+\frac{\alpha zq'(z)}{-r(z)}\,.$$

The remaining part of the proof of Theorem 2.5 is similar to that of Theorem 2.1, and so we omit it.
