

On The Small-Time Local Controllability

Mikhail Iv. Krastanov*, Margarita N. Nikolova[†]

A class of polynomial control systems is considered. The local properties of the corresponding reachable sets are studied by using a general differential geometrical approach based on the Campbell-Baker-Hausdorff formula. Two sufficient conditions as well as a necessary condition for small-time local controllability are presented. Suitable examples illustrate the existing gap between the presented necessary and sufficient conditions.
