## MOST GENERAL FRACTIONAL REPRESENTATION FORMULA FOR FUNCTIONS AND IMPLICATIONS

George A. Anastassiou

*Communicated by S. T. Rachev*

**ABSTRACT.** Here we present the most general fractional representation formulae for a function in terms of the most general fractional integral operators due to S. Kalla, [3], [4], [5]. The last include most of the well-known fractional integrals such as of Riemann-Liouville, Erdélyi-Kober and Saigo, etc. Based on these we derive very general fractional Ostrowski type inequalities.

**1. Introduction.** Let  $f : [a, b] \rightarrow \mathbb{R}$  be differentiable on  $[a, b]$ , and  $f' : [a, b] \rightarrow \mathbb{R}$  be integrable on  $[a, b]$ , then the following Montgomery identity holds [10]:

$$(1) \quad f(x) = \frac{1}{b-a} \int_a^b f(t) dt + \int_a^b P_1(x, t) f'(t) dt,$$

---

2010 *Mathematics Subject Classification:* 26A33, 26D10, 26D15.

*Key words:* Fractional representation, Kalla fractional integral, Ostrowski inequality.

where  $P_1(x, t)$  is the Peano kernel

$$(2) \quad P_1(x, t) = \begin{cases} \frac{t-a}{b-a}, & a \leq t \leq x, \\ \frac{t-b}{b-a}, & x < t \leq b, \end{cases}$$

The Riemann-Liouville integral operator of order  $\alpha > 0$  with anchor point  $a \in \mathbb{R}$  is defined by

$$(3) \quad J_a^\alpha f(x) := \frac{1}{\Gamma(\alpha)} \int_a^x (x-t)^{\alpha-1} f(t) dt,$$

$$(4) \quad J_a^0 f(x) := f(x), \quad x \in [a, b].$$

Properties of the above operator can be found in [9].

When  $\alpha = 1$ ,  $J_a^1$  reduces to the classical integral.

In [1] we proved the following fractional representation formula of Montgomery identity type.

**Theorem 1.** *Let  $f : [a, b] \rightarrow \mathbb{R}$  be differentiable on  $[a, b]$ , and  $f' : [a, b] \rightarrow \mathbb{R}$  be integrable on  $[a, b]$ ,  $\alpha \geq 1$ ,  $x \in [a, b)$ . Then*

$$(5) \quad f(x) = (b-x)^{1-\alpha} \Gamma(\alpha) \left\{ \frac{J_a^\alpha f(b)}{b-a} - J_a^{\alpha-1}(P_1(x, b) f(b)) + J_a^\alpha(P_1(x, b) f'(b)) \right\}.$$

When  $\alpha = 1$  the last (5) reduces to classic Montgomery identity (1).

Motivated by (5), here we establish a very general fractional representation formula based on the most general fractional integral due to S. Kalla, [3], [4], [5]. The last integral includes almost all other fractional integrals as special cases. We then establish a very general fractional Ostrowski type inequality.

We finish with applications.

**2. Main results.** Here let  $f : \mathbb{R}_+ \rightarrow \mathbb{R}$  differentiable with  $f' : \mathbb{R}_+ \rightarrow \mathbb{R}$  be integrable. Let also  $\Phi : [0, 1] \rightarrow \mathbb{R}_+$  a general kernel function, which is differentiable with  $\Phi' : [0, 1] \rightarrow \mathbb{R}_+$  being integrable too. For  $z$  in  $(0, 1)$  we assume  $\Phi(z) > 0$ .

Let here the parameters  $\gamma, \delta$  be such that  $\gamma > -1$  and  $\delta \in \mathbb{R}$ . Set  $\varepsilon := \delta - \gamma - 1$ , that is  $\delta = \varepsilon + \gamma + 1$ .

The most general fractional integral operator was defined by S. Kalla ([3], [4], [5]), see also [7], as follows:

$$(6) \quad I_{\Phi}^{\gamma, \delta} f(x) := x^{\delta} \int_0^1 \Phi(\sigma) \sigma^{\gamma} f(x\sigma) d\sigma,$$

for any  $x > 0$ , with  $I_{\Phi}^{\gamma, \delta} f(0) := 0$ .

Here we consider  $b > 0$  fixed, and  $0 < x < b$ . We operate on  $[0, b]$ .

By convenient change of variable we can rewrite  $I_{\Phi}^{\gamma, \delta} f(x)$  as follows:

$$(7) \quad I_{\Phi}^{\gamma, \varepsilon} f(x) := x^{\varepsilon} \int_0^x \Phi\left(\frac{w}{x}\right) w^{\gamma} f(w) dw.$$

That is

$$(8) \quad I_{\Phi}^{\gamma, \varepsilon} f(x) = I_{\Phi}^{\gamma, \delta} f(x), \text{ for any } x > 0.$$

We take  $\gamma > 0$  from now on.

We present the following most general fractional representation formula.

**Theorem 2.** *All as above described. Then*

$$(9) \quad f(x) = b^{\gamma+1-\delta} x^{-\gamma} \left( \Phi\left(\frac{x}{b}\right) \right)^{-1} \left[ \frac{1}{b} I_{\Phi}^{\gamma, \delta} f(b) + \gamma I_{\Phi}^{\gamma-1, \delta} (P_1(x, b) f(b)) \right. \\ \left. + \frac{1}{b} I_{\Phi'}^{\gamma, \delta} (P_1(x, b) f(b)) + I_{\Phi}^{\gamma, \delta} (P_1(x, b) f'(b)) \right].$$

**Proof.** We observe that

$$(10) \quad I_{\Phi}^{\gamma, \varepsilon} (P_1(x, b) f'(b)) = b^{\varepsilon} \int_0^b \Phi\left(\frac{w}{b}\right) w^{\gamma} P_1(x, w) f'(w) dw =$$

$$(11) \quad b^{\varepsilon} \left[ \int_0^x \Phi\left(\frac{w}{b}\right) w^{\gamma} \frac{w}{b} f'(w) dw + \int_x^b \Phi\left(\frac{w}{b}\right) w^{\gamma} \left(\frac{w-b}{b}\right) f'(w) dw \right] = \\ b^{\varepsilon-1} \left[ \int_0^x \Phi\left(\frac{w}{b}\right) w^{\gamma+1} f'(w) dw + \int_x^b \Phi\left(\frac{w}{b}\right) (w^{\gamma+1} - bw^{\gamma}) f'(w) dw \right] =$$

$$\begin{aligned}
& b^{\varepsilon-1} \left[ \Phi \left( \frac{x}{b} \right) x^{\gamma+1} f(x) - \int_0^x f(w) d \left( \Phi \left( \frac{w}{b} \right) w^{\gamma+1} \right) - \right. \\
& \left. \Phi \left( \frac{x}{b} \right) (x^{\gamma+1} - bx^{\gamma}) f(x) - \int_x^b f(w) d \left( \Phi \left( \frac{w}{b} \right) (w^{\gamma+1} - bw^{\gamma}) \right) \right] = \\
(12) \quad & b^{\varepsilon-1} \left[ bx^{\gamma} \Phi \left( \frac{x}{b} \right) f(x) - \int_0^x f(w) \left[ \frac{1}{b} \Phi' \left( \frac{w}{b} \right) w^{\gamma+1} + (\gamma+1) \Phi \left( \frac{w}{b} \right) w^{\gamma} \right] dw - \right. \\
& \left. \int_x^b f(w) \left[ \frac{1}{b} \Phi' \left( \frac{w}{b} \right) (w^{\gamma+1} - bw^{\gamma}) + \Phi \left( \frac{w}{b} \right) ((\gamma+1) w^{\gamma} - b\gamma w^{\gamma-1}) \right] dw \right] = \\
& b^{\varepsilon-1} \left[ bx^{\gamma} \Phi \left( \frac{x}{b} \right) f(x) - \frac{1}{b} \int_0^x f(w) \Phi' \left( \frac{w}{b} \right) w^{\gamma+1} dw - \right. \\
& \left. (\gamma+1) \int_0^x f(w) \Phi \left( \frac{w}{b} \right) w^{\gamma} dw - \int_0^b f(w) \left[ \frac{1}{b} \Phi' \left( \frac{w}{b} \right) (w^{\gamma+1} - bw^{\gamma}) + \right. \right. \\
(13) \quad & \left. \left. \Phi \left( \frac{w}{b} \right) ((\gamma+1) w^{\gamma} - b\gamma w^{\gamma-1}) \right] dw + \int_0^x f(w) \left[ \frac{1}{b} \Phi' \left( \frac{w}{b} \right) (w^{\gamma+1} - bw^{\gamma}) + \right. \right. \\
& \left. \left. \Phi \left( \frac{w}{b} \right) ((\gamma+1) w^{\gamma} - b\gamma w^{\gamma-1}) \right] dw \right] = \\
& b^{\varepsilon-1} \left[ bx^{\gamma} \Phi \left( \frac{x}{b} \right) f(x) - \frac{1}{b} \int_0^b f(w) \Phi' \left( \frac{w}{b} \right) w^{\gamma+1} dw + \int_0^b f(w) \Phi' \left( \frac{w}{b} \right) w^{\gamma} dw - \right. \\
& \left. (\gamma+1) \int_0^b f(w) \Phi \left( \frac{w}{b} \right) w^{\gamma} dw + b\gamma \int_0^b f(w) \Phi \left( \frac{w}{b} \right) w^{\gamma-1} dw - \right. \\
(14) \quad & \left. \int_0^x f(w) \Phi' \left( \frac{w}{b} \right) w^{\gamma} dw - b\gamma \int_0^x f(w) \Phi \left( \frac{w}{b} \right) w^{\gamma-1} dw \right] =: (\eta).
\end{aligned}$$

We notice that

$$\begin{aligned}
& -\frac{1}{b} \int_0^b f(w) \Phi' \left( \frac{w}{b} \right) w^{\gamma+1} dw = - \left[ \int_0^x f(w) \Phi' \left( \frac{w}{b} \right) \frac{w}{b} w^{\gamma} dw + \right. \\
(15) \quad & \left. \int_x^b f(w) \Phi' \left( \frac{w}{b} \right) \frac{(w-b)}{b} w^{\gamma} dw + \int_x^b f(w) \Phi' \left( \frac{w}{b} \right) w^{\gamma} dw \right] =
\end{aligned}$$

$$\begin{aligned}
 & - \int_0^b f(w) \Phi' \left( \frac{w}{b} \right) P_1(x, w) w^\gamma dw - \int_0^b f(w) \Phi' \left( \frac{w}{b} \right) w^\gamma dw \\
 & \quad + \int_0^x f(w) \Phi' \left( \frac{w}{b} \right) w^\gamma dw.
 \end{aligned}$$

Furthermore we have

$$\begin{aligned}
 & -\gamma \int_0^b f(w) \Phi \left( \frac{w}{b} \right) w^\gamma dw = -\gamma \left[ b \int_0^x f(w) \Phi \left( \frac{w}{b} \right) \frac{w}{b} w^{\gamma-1} dw + \right. \\
 (16) \quad & \left. b \int_x^b f(w) \Phi \left( \frac{w}{b} \right) \frac{(w-b)}{b} w^{\gamma-1} dw + b \int_x^b f(w) \Phi \left( \frac{w}{b} \right) w^{\gamma-1} dw \right] = \\
 & -b\gamma \int_0^b f(w) \Phi \left( \frac{w}{b} \right) P_1(x, w) w^{\gamma-1} dw - b\gamma \int_0^b f(w) \Phi \left( \frac{w}{b} \right) w^{\gamma-1} dw \\
 & \quad + b\gamma \int_0^x f(w) \Phi \left( \frac{w}{b} \right) w^{\gamma-1} dw.
 \end{aligned}$$

Putting together (10), (14), (15), (16) we obtain

$$\begin{aligned}
 & I_{\Phi}^{\gamma, \varepsilon} (P_1(x, b) f'(b)) = (\eta) = \\
 (17) \quad & b^{\varepsilon-1} \left[ bx^\gamma \Phi \left( \frac{x}{b} \right) f(x) - \int_0^b f(w) \Phi' \left( \frac{w}{b} \right) P_1(x, w) w^\gamma dw - \right. \\
 & \left. \int_0^b f(w) \Phi \left( \frac{w}{b} \right) w^\gamma dw - b\gamma \int_0^b f(w) \Phi \left( \frac{w}{b} \right) P_1(x, w) w^{\gamma-1} dw \right] = \\
 & \quad b^{\varepsilon-1} \left[ bx^\gamma \Phi \left( \frac{x}{b} \right) f(x) - \frac{1}{b^\varepsilon} I_{\Phi'}^{\gamma, \varepsilon} (P_1(x, b) f(b)) \right. \\
 (18) \quad & \left. - \frac{1}{b^\varepsilon} I_{\Phi}^{\gamma, \varepsilon} f(b) - \gamma b^{1-\varepsilon} I_{\Phi}^{\gamma-1, \varepsilon} (P_1(x, b) f(b)) \right] = \\
 & b^\varepsilon x^\gamma \Phi \left( \frac{x}{b} \right) f(x) - \frac{1}{b} I_{\Phi'}^{\gamma, \varepsilon} (P_1(x, b) f(b)) - \frac{1}{b} I_{\Phi}^{\gamma, \varepsilon} f(b) - \gamma I_{\Phi}^{\gamma-1, \varepsilon} (P_1(x, b) f(b)).
 \end{aligned}$$

That is

$$I_{\Phi}^{\gamma, \varepsilon} (P_1(x, b) f'(b)) = b^\varepsilon x^\gamma \Phi \left( \frac{x}{b} \right) f(x) -$$

$$(19) \quad \frac{1}{b} I_{\Phi'}^{\gamma, \varepsilon} (P_1(x, b) f(b)) - \frac{1}{b} I_{\Phi}^{\gamma, \varepsilon} f(b) - \gamma I_{\Phi}^{\gamma-1, \varepsilon} (P_1(x, b) f(b)).$$

Solving the last (19) for  $f(x)$  we get

$$(20) \quad f(x) = b^{-\varepsilon} x^{-\gamma} \left( \Phi \left( \frac{x}{b} \right) \right)^{-1} \left[ \frac{1}{b} I_{\Phi}^{\gamma, \varepsilon} f(b) + \gamma I_{\Phi}^{\gamma-1, \varepsilon} (P_1(x, b) f(b)) + \frac{1}{b} I_{\Phi'}^{\gamma, \varepsilon} (P_1(x, b) f(b)) + I_{\Phi}^{\gamma, \varepsilon} (P_1(x, b) f'(b)) \right],$$

proving the claim.  $\square$

Next we establish a very general fractional Ostrowski type inequality.

**Theorem 3.** *Here all as in Theorem 2. Then*

$$(21) \quad \left| f(x) - b^{\gamma+1-\delta} x^{-\gamma} \left( \Phi \left( \frac{x}{b} \right) \right)^{-1} \left[ \frac{1}{b} I_{\Phi}^{\gamma, \delta} f(b) + \gamma I_{\Phi}^{\gamma-1, \delta} (P_1(x, b) f(b)) + \frac{1}{b} I_{\Phi'}^{\gamma, \delta} (P_1(x, b) f(b)) \right] \right| \leq b^{-1} x^{-\gamma} \left( \Phi \left( \frac{x}{b} \right) \right)^{-1} \|\Phi\|_{\infty, [0,1]} \|f'\|_{\infty, [0,b]} \left[ \frac{(2x^{\gamma+2} - b^{\gamma+2})}{\gamma+2} + \frac{b(b^{\gamma+1} - x^{\gamma+1})}{\gamma+1} \right].$$

*Proof.* We observe that

$$(22) \quad \left| I_{\Phi}^{\gamma, \delta} (P_1(x, b) f'(b)) \right| = \left| I_{\Phi}^{\gamma, \varepsilon} (P_1(x, b) f'(b)) \right| = b^{\varepsilon} \left| \int_0^b \Phi \left( \frac{w}{b} \right) w^{\gamma} P_1(x, w) f'(w) dw \right| \leq b^{\varepsilon} \int_0^b \Phi \left( \frac{w}{b} \right) w^{\gamma} |P_1(x, w)| |f'(w)| dw \leq$$

$$(23) \quad b^{\varepsilon} \|\Phi\|_{\infty, [0,1]} \|f'\|_{\infty, [0,b]} \int_0^b w^{\gamma} |P_1(x, w)| dw =$$

$$b^{\varepsilon} \|\Phi\|_{\infty, [0,1]} \|f'\|_{\infty, [0,b]} \left[ \frac{1}{b} \int_0^x w^{\gamma+1} dw + \frac{1}{b} \int_x^b w^{\gamma} (b-w) dw \right] =$$

$$(24) \quad b^{\varepsilon-1} \|\Phi\|_{\infty, [0,1]} \|f'\|_{\infty, [0,b]} \left[ \frac{2x^{\gamma+2}}{\gamma+2} + \frac{b}{\gamma+1} (b^{\gamma+1} - x^{\gamma+1}) - \frac{b^{\gamma+2}}{\gamma+2} \right].$$

That is we derived

$$(25) \quad b^{\delta-\gamma-2} \|\Phi\|_{\infty,[0,1]} \|f'\|_{\infty,[0,b]} \left[ \frac{(2x^{\gamma+2} - b^{\gamma+2})}{\gamma + 2} + \frac{b(b^{\gamma+1} - x^{\gamma+1})}{\gamma + 1} \right].$$

The claim is proved.  $\square$

### 3. Applications. We mention

**Definition 4.** Let  $\alpha > 0, \beta, \eta \in \mathbb{R}$ , then the Saigo fractional integral  $I_{0,t}^{\alpha,\beta,\eta}$  of order  $\alpha$  for  $f \in C(\mathbb{R}_+)$  is defined by ([12], see also [6, p. 19], [11]):

$$(26) \quad I_{0,t}^{\alpha,\beta,\eta} \{f(t)\} = \frac{t^{-\alpha-\beta}}{\Gamma(\alpha)} \int_0^t (t-\tau)^{\alpha-1} {}_2F_1\left(\alpha+\beta, -\eta; \alpha; 1-\frac{\tau}{t}\right) f(\tau) d\tau,$$

where the function  ${}_2F_1$  in (26) is the Gaussian hypergeometric function defined by

$$(27) \quad {}_2F_1(a, b; c; t) = \sum_{n=0}^{\infty} \frac{(a)_n (b)_n t^n}{(c)_n n!},$$

and  $(a)_n$  is the Pochhammer symbol  $(a)_n = a(a+1)\dots(a+n-1)$ ,  $(a)_0 = 1$ ; where  $c \neq 0, -1, -2, \dots$ .

**Note 5.** Given that  $a + b < c$ ,  ${}_2F_1$  converges on  $[-1, 1]$ , see [2].

Furthermore we have

$$(28) \quad \frac{d {}_2F_1(a, b; c; t)}{dt} = \left(\frac{ab}{c}\right) {}_2F_1(a+1, b+1; c+1; t),$$

which converges on  $[-1, 1]$  when  $1 + a + b < c$ . So when  $1 + a + b < c$ , then both (27) and (28) converge on  $[-1, 1]$ . Therefore when  $\eta > 1 + \beta$  we get that both  ${}_2F_1\left(\alpha + \beta, -\eta; \alpha; 1 - \frac{\tau}{t}\right)$  and its derivative with respect to  $\tau : \left(\frac{(\alpha + \beta)\eta}{t\alpha}\right) {}_2F_1\left(\alpha + \beta + 1, -\eta + 1; \alpha + 1; 1 - \frac{\tau}{t}\right)$ , converge on  $[0, 1]$ ; notice here  $0 \leq 1 - \frac{\tau}{t} \leq 1, t > 0$ .

**Remark 6.** The integral operator  $I_{0,t}^{\alpha,\beta,\eta}$  includes both the Riemann-Liouville and the Erdélyi-Kober fractional integral operators given by

$$(29) \quad J_0^\alpha \{f(x)\} = I_{0,t}^{\alpha,-\alpha,\eta} \{f(t)\} = \frac{1}{\Gamma(\alpha)} \int_0^t (t-\tau)^{\alpha-1} f(\tau) d\tau \quad (\alpha > 0),$$

and

(30)

$$I^{\alpha,\eta}\{f(t)\} = I_{0,t}^{\alpha,0,\eta}\{f(t)\} = \frac{t^{-\alpha-\eta}}{\Gamma(\alpha)} \int_0^t (t-\tau)^{\alpha-1} \tau^\eta f(\tau) d\tau \quad (\alpha > 0, \eta \in \mathbb{R}).$$

**Remark 7.** By a simple change of variable ( $w = \frac{\tau}{t}$ ) we get

$$(31) \quad I_{0,t}^{\alpha,\beta,\eta}\{f(t)\} = \frac{t^{-\beta}}{\Gamma(\alpha)} \int_0^1 (1-w)^{\alpha-1} {}_2F_1(\alpha+\beta, -\eta; \alpha; 1-w) f(tw) dw.$$

Similarly we find

$$(32) \quad J_0^\alpha\{f(t)\} = \frac{t^\alpha}{\Gamma(\alpha)} \int_0^1 (1-w)^{\alpha-1} f(tw) dw,$$

and

$$(33) \quad I^{\alpha,\eta}\{f(t)\} = \frac{1}{\Gamma(\alpha)} \int_0^1 (1-w)^{\alpha-1} w^\eta f(tw) dw.$$

**Remark 8** ([8]). The above Saigo fractional integral (26) and its special cases of Riemann-Liouville and Erdélyi-Kober fractional integrals (29), (30), are all examples of the S. Kalla ([5]) generalized fractional integral in the reduced form

$$(34) \quad K_{\Phi}^\gamma f(x) = x^{-\gamma-1} \int_0^x \Phi\left(\frac{w}{x}\right) w^\gamma f(w) dw = \int_0^1 \Phi(\sigma) \sigma^\gamma f(x\sigma) d\sigma,$$

where  $x > 0$ ,  $\gamma > -1$  and  $\Phi$  continuous arbitrary Kernel function.

Notice that (by (6) and (34))

$$(35) \quad I_{\Phi}^{\gamma,\delta} f(x) = x^\delta K_{\Phi}^\gamma f(x),$$

for any  $x > 0$ , where  $\gamma > -1$  and  $\delta \in \mathbb{R}$ .

So for  $b > 0$  we get

$$(36) \quad I_{\Phi}^{\gamma,\delta} f(b) = b^\delta K_{\Phi}^\gamma f(b).$$

Next we restrict ourselves to  $\gamma > 0$ . By Theorem 2 and (36) we obtain the following general fractional representation formula

**Theorem 9.** *It holds*

$$\begin{aligned}
 f(x) &= b^{\gamma+1-\delta} x^{-\gamma} \left( \Phi \left( \frac{x}{b} \right) \right)^{-1} \left[ b^{\delta-1} K_{\Phi}^{\gamma} f(b) + \gamma b^{\delta} K_{\Phi}^{\gamma-1} (P_1(x, b) f(b)) + \right. \\
 (37) \quad & \left. b^{\delta-1} K_{\Phi'}^{\gamma} (P_1(x, b) f(b)) + b^{\delta} K_{\Phi}^{\gamma} (P_1(x, b) f'(b)) \right].
 \end{aligned}$$

We finish the following very general fractional Ostrowski type inequality, a direct application of (21) and (36).

**Theorem 10.** *All as in Theorem 3. Then*

$$\begin{aligned}
 (38) \quad & \left| f(x) - b^{\gamma+1-\delta} x^{-\gamma} \left( \Phi \left( \frac{x}{b} \right) \right)^{-1} \left[ b^{\delta-1} K_{\Phi}^{\gamma} f(b) + \right. \right. \\
 & \left. \left. \gamma b^{\delta} K_{\Phi}^{\gamma-1} (P_1(x, b) f(b)) + b^{\delta-1} K_{\Phi'}^{\gamma} (P_1(x, b) f(b)) \right] \right| \leq \\
 & b^{-1} x^{-\gamma} \left( \Phi \left( \frac{x}{b} \right) \right)^{-1} \|\Phi\|_{\infty, [0,1]} \|f'\|_{\infty, [0,b]} \left[ \frac{(2x^{\gamma+2} - b^{\gamma+2})}{\gamma + 2} + \frac{b(b^{\gamma+1} - x^{\gamma+1})}{\gamma + 1} \right].
 \end{aligned}$$

**Comment 11.** One can apply (37) and (38) for the Riemann-Liouville and Erdélyi-Kober fractional integrals, as well as many other fractional integrals. To keep article short we omit this task.
